

Edwards Air Force Base California

2021 Water Quality Report

2021 Monitoring Results for Edwards AFB – Main Base (Public Water System ID: CA1510701)
Prepared By: 412th Test Wing – Bioenvironmental Engineering Flight

Annual Consumer Report

We feel it is important that our consumers know about where our water comes from, what it contains, and how it compares to requirements set by regulatory agencies. This report is a snapshot of last year's water quality.

Last year, as in years past, our tap water met or exceeded all U.S. Environmental Protection Agency (USEPA) and state drinking water health requirements.

Through regular monitoring, any contaminates found were verified to be within regulatory standards. The detected amounts and the associated standards, are included in the tables published within this report.

Where Does Our Water Come From?

The EAFB Drinking Water System draws water from two sources:

- Antelope Valley East Kern (AVEK) Water Agency
- On-base groundwater wells

EAFB receives a majority of our water supply from the Antelope Valley East Kern (AVEK) Water Agency. The water received from the AVEK is supplied to EAFB in finished drinking water quality form. The AVEK supply is primarily from the California aqueduct, a surface water source that currently has 12 Wells as of 2018. AVEK's alternative supply is State Water Project water, which has been stored in the aquifer at various underground storage facilities (i.e. "water banks"). This water is extracted as local groundwater for water quality purposes or as supply during drought. As a water wholesaler, the AVEK Water Agency published their 2021 Water Quality Report earlier this year, which is located at https://www.avek.org/2021-annual-water-quality-report-kern-county-system.

Additionally, water provided from AVEK is mixed with water supplied from on-base wells. In 2021, groundwater was supplied from two installation wells. One was used in combination with the AVEK supply to feed the main drinking water distribution system. The other well was used to feed a small section of the West Base area. All wells are located within the base boundaries, primarily near South and West Base areas. These wells are fed by the Antelope Valley Aquifer.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien.

Treatment Process

Our water is treated with chlorine, which is a disinfectant that kills dangerous bacteria and other microorganisms that may be in the water. The 412th Civil Engineering Squadron monitors the disinfectant levels on a daily basis.

Pictured above: A technician from the 412th Operational Medical Readiness Squadron, Bioenvironmental Engineering Flight, conducting routine water testing at locations spanning the water distribution system. Water samples are collected, tested by a certified laboratory, and results are submitted to the State Water Resources Control Board to demonstrate compliance with all requirements and regulations.

Source Water Assessment

The 412th Civil Engineering (CE) Squadron completed our Source Water Assessment on 18 June 2003 and it is on file in the CE Water & Gas office (661-277-5000). This assessment looks at possible contamination sources that may affect the base water supply. Possible contaminating activities for the wells surveyed in this assessment include nearby abandoned wells, storm drainage discharge, above ground water storage tanks, and nearby roads. The health risks from these activities are diminished through weekly monitoring of the potable water system.

AVEK also maintains a Source Water Assessment for the water they distribute. This is a federal requirement, and lists the Physical Barrier Effectiveness, Inventory of Possible Contaminating Activities, Vulnerability Ranking, Assessment Map, Assessment Summary, and Public Notification procedures. A copy of these assessments may be viewed at Antelope Valley-East Kern Water Agency, 6500 West Avenue N, Palmdale, CA 93551.

What Is In Drinking Water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (1-800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Consumption Note for Susceptible Individuals

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Water Quality Data Table

All sources of drinking water contain some naturally occurring contaminants. At low levels, these substances are generally not harmful in our drinking water. Removing all contaminants would be extremely expensive, and in most cases, would not provide increased protection of public health. Additionally, some naturally occurring minerals provide benefits by improving the taste of drinking water and providing nutritional value at low levels.

In order to ensure that tap water is safe to drink, the USEPA prescribes regulations which limit the amount of contaminants in water provided by public water systems. The tables on the following pages list all of the drinking water contaminants that were detected during the 2021 calendar year of this report or are the most recent detected level within the past 9 years. Many more contaminants were tested than listed on the following table; but we only report those that were detected in our water with the exception of Lead. Lead level is require regardless whether or not it is detected. The USEPA and state allow us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently, or because the system is not considered vulnerable to this type of contamination. As such, some of our data, though representative, is more than one year old.

In these tables you may find terms and abbreviations that might not be familiar to you. To help you better understand these terms, we have provided their definitions below.

Important Terms Used										
Term	Definition									
AL	Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.									
LRAA	Locational Running Annual Average: Annual running average at a single sampling site.									
HAA5	Sum of Five Regulated HAAs, i.e., Monochloroacetic Acid, Monobromoacetic Acid, Dichloroacetic Acid, Dibromoacetic Acid, and Trichloroacetic Acid									
MCL	Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.									
MCLG	Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency.									
MFL	MFL: million fibers per liter, used to measure asbestos concentration									
mg/L	Mg/L: Milligrams per Liter (ppm)									
MRDL	Maximum residual disinfectant level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants									
MRDLG	Maximum residual disinfection level goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.									
N/A	Not Applicable									
ND	Not Detected									
pCi/L	pCi/L: picocuries per liter (a measure of radioactivity)									
PDWS	Primary Drinking Water Standards: MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.									
PHG	Public Health Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.									
ppb	ppb: parts per billion, or micrograms per liter (μg/L)									
ppm	ppm: parts per million, or milligrams per liter (mg/L)									
SDWS	Secondary Drinking Water Standards: MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.									
TTHM	Total Trihalomethanes, or Sum of Four Regulated THMs, <i>i.e.</i> , Chloroform, Bromodichloromethane, Dibromochloromethane, and Bromoform									
μs/cm	μs/cm: micro Siemens per centimeter (a measure of conductivity of a solution)									
μg/L	μ/L: Micrograms per Liter (ppb)									

Distribution System Water Quality Data Table													
Contaminant	MCL	PHG	AVEK Plant Average ¹	AVEK Wells Average ²	EAFB Well Average	EAFB Well Range	Blended Water Monthly Average Range ³	West Base Well Average	Sample Date	Violation	Major Sources in Drinking Water		
Inorganic Compounds													
Aluminum (μg/L)	1000	600	53	ND	ND	NA	NA	ND	2021	No	Erosion of natural deposits; residue from some surface water treatment processes		
Arsenic (µg/L)	10	0.004	4.0	4.9	8.98	7-12	4.63-7.83	2.68	2021	No	Erosion of natural deposits; runoff from orchards; glass and electronics production wastes		
Barium (µg/L)	1000	2000	59	ND	21	NA	NA	31	2021	No	Discharges of oil drilling wastes and from metal refineries; erosion of natural deposits		
Total Chromium (ug/L)	50	MCLG= 100	7.1	ND	8.3	NA	NA	3.2	2021	No	Discharge from steel and pulp mills and chrome plating; erosion of natural deposits		
Hexavalent Chromium ⁴ (ug/L)	10	0.02	5.8	2.9	6.07	NA	NA	ND	2014	No	Discharge from electroplating factories, leather tanneries, wood preservation, chemical synthesis, refractory production, and textile manufacturi facilities; erosion of natural deposits		
Fluoride (mg/L)	2	1	0.27	0.15	0.44	NA	NA	0.76	2021	No	Erosion of natural deposits; water additive that promotes strong teeth; discharge from fertilizer and aluminum factories		
Selenium (µg/L)	50	30	ND	0.64	ND	NA	NA	ND	2021	No	Discharge from petroleum, glass, and metal refineries; erosion of natural deposits; discharge from mines and chemical manufacture runoff from livestock lots (feed additive)		
Nickel (μg/L)	100	12	ND	ND	70	NA	NA	ND	2021	No	Erosion of natural deposits, runoff from power plants, factories, and fertilizer.		
Nitrate (as N) (mg/L)	10	10	2.6	2.6	0.27	NA	NA	1.7	2021	No	Runoff and leaching from fertilizer use; leaching from septic tanks and sewage; erosion of natural deposits		
Sampling Results Showing the Detection of Lead and Copper													
Lead ⁵ (μg/L)	AL=90% of sites <15	0.2	ND	ND	ND	40 sites sampled; 0 sites over AL	NA	NA	2021	No	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits		
Copper ⁵ (mg/L)	AL=90% of sites <1.3	0.3	ND	ND	0.138	40 sites sampled; 0 sites over AL	NA	NA	2021	No	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives		
Radioactive Contaminants (PDWS)													
Gross Alpha (pCi/L)	15	MCLG=	NA	5.3	ND	NA	NA	6.6	2021	No	Erosion of natural deposits		
Uranium (pCi/L)	20	0.43	NA	NA	ND	NA	NA	2.9	2021	No	Erosion of natural deposits		
Tritium (pCi/L)	20,000	400	NA	5.9	NA	NA	NA	NA	NA	No	Decay of natural and man-made deposits		

Water Quality Data Table

Water Quarty Butter Tuble											
Contaminant	Secondary MCL ⁶	AVEK Plant Average	AVEK Wells Average	EAFB Average	EAFB Range	West Base Well Average	Sample Date	Violation	Major Sources in Drinking Water		
Secondary Standard Contaminants (SDWS)											
Calcium (mg/L)	N/A	58	75	34	NA	31	2021	No	Leaching from natural deposits		
Chloride (mg/L)	500	55	70	5.2	NA	72	2021	No	Runoff/leaching from natural deposits; seawater influence		
Color (units)	15	<5	<5	ND	NA	ND	2021	No	Naturally-occurring organic materials		
Hardness (mg/L)	N/A	180	220	54	NA	94	2021	No	The sum of polyvalent cations present in the water, generally naturally occurring magnesium and calcium		
Iron μg/L)	300	ND	ND	140	NA	150	2021	No	Leaching from natural deposits; industrial wastes		
Magnesium (mg/L)	N/A	9.1	8.5	2.3	NA	3.6	2021		Erosion of minerals and natural deposits		
Sodium (mg/L)	N/A	43	43	57	NA	120	2021	No	Leaching from natural deposits		
Specific Conductance (µs/cm)	1600	580	650	330	NA	730	2021	No	Substances that form ions when in water; seawater influence		
Sulfate (mg/L)	500	52	56	55	NA	140	2021	No	Runoff/leaching from natural deposits; industrial wastes		
Total Dissolved Solids (mg/L)	1000	360	390	200	NA	490	2021	No	Runoff/leaching from natural deposits		
Turbidity (units)	5	0.05	0.05	0.1	NA	3	2021	No	Soil runoff		
Zinc (ug/L)	5000	520	ND	75	NA	ND	2021	No	Runoff/leaching from natural deposits; industrial wastes		
Disinfectants & Disinfection By Products (PDWS) ⁷											
Total Trihalomethanes (μg/L)	LRAA: 80	24	NA	60.5	20-60.5	NA	2021	No	Byproduct of drinking water disinfection		
Haloacetic Acids (μg/L)	LRAA: 60	3.7	NA	4.95	2.35-4.95	NA	2021	No	Byproduct of drinking water disinfection		
<>< Table Continues on Next Page >>>											

<<< Table Continues on Next Page >>>

- 1. AVEK Plant Average data obtained from previous Kern County Annual Water Quality Reports
- 2. AVEK Wells Average data obtained from 2021 Annual Water Quality Report Kern County
- 3. Blended water is the water delivered to the end user. Because of the high levels of arsenic in the wells, EAFB is on an approved plan by the State Water Resources Control Board to bland with AVEK water. The blending ratio is roughly 4:1 AVEK influent: EAFB Well.
 - a. Water quality compliance is reported based on blended water results.
- 4. There is currently no MCL for hexavalent chromium. The previous MCL of 0.010 mg/L (10 ppb) was withdrawn on September 11, 2017
- 5. Lead and Copper is regulated by ensuring the 90th percentile of sample result in under the AL. In this case, all of our test for Lead came back as ND but we are still require to report them. Sampling is conducted every 3 years. The most recent samples are form August 2021. No schools requested lead or copper sampling in 2021.
- 6. Secondary MCLs do not have PHGs or MCLGs because secondary MCLs are set to protect the aesthetics of water and PHGs and MCLGs are based on health concerns.
- 7. Disinfection Byproduct (DBPs), which includes Trihalomethanes and Haloacetic Acids, detections increased most likely due to a lack of usage during the COVID-19 Pandemic. Two additional sites were added to the sampling schedule for monitoring purposes, approved by the State Water Resources Control Board on December 10, 2020.

Water Quality Data Table											
Contaminant	MCL	MCLG	Total Positive Samples	Range	Sample Date	Violation	Major Sources in Drinking Water				
Microbiological Contaminants (PDWS)											
Total Coliform Bacteria (in the distribution system)	1 positive monthly sample	0	1	ND - 18	2021	No	Naturally present in the environment				
Fecal Indicator <i>E. coli</i> (at the groundwater source)	0	0	0	ND –ND	2021	No	Human or animal fecal waste				

8. One sample on October 19, 2021 tested positive for total coliform initially. Repeat sampling concluded that no sites which initially tested positive for total coliform bacteria tested positive for *E.coli* bacteria. Our assessment indicates that weather conditions like extensive rainfall, stagnant water or error in sampling protocol may have affected the sampling results. After re-sampling, the results were indicated as negative.

Additional Information Regarding Total Coliforms

Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria may be present. Coliforms were found in more samples than allowed and this was a warning of potential problems.

Additional Information Regarding Fecal Coliform and <u>E. coli</u>

Fecal coliforms and *E. coli* are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Microbes in these wastes can cause short-term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a special health risk for infants, young children, some of the elderly, and people with severely compromised immune systems.

Additional Information for Water Quality in Low-Use Buildings due to COVID-19

Please view the following links for information on how to ensure good water quality in buildings that may have a lack of usage due to the COVID-19 Pandemic. 412th Civil

Engineering ensures the distribution system of EAFB is flushed and pulling fresh water.

https://www.epa.gov/coronavirus/information-maintaining-or-restoring-water-quality-buildings-low-or-no-use

Additional Information Regarding Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. 412th Bioenvironmental Engineering Flight and 412th Civil Engineering Squadron are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (800-426-4791) or at http://www.epa.gov/lead.

In addition to the 30 housing sites sampled for lead in 2021, the Bioenvironmental Engineering flight sampled the Edwards AFB's Child Development Center and School Age Program in 2006. All water fixtures where sampled, and all samples met federal limits. In June and July of 2016, additional sampling was conducted for new water fixtures; again all samples met federal limits.

Additional Information Regarding Arsenic

While your drinking water meets federal and state standard for arsenic, it does contain low levels of arsenic. The arsenic standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. The U.S. Environmental Protection Agency continues to research the health effects of low levels of arsenic which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

Additional Information Regarding Fluoride

The EAFB and AVEK water systems contain naturally occurring fluoride. Neither EAFB nor AVEK add additional fluoride to the water system due to State requirements and the scope/size of the EAFB water distribution system. The natural level of fluoride present in the water system is below the maximum contamination limit (MCL) of 2.0 parts per million (ppm).

In 2015, the U.S. Department of Health and Human Services released a Public Health Service recommendation of 0.7 ppm as the optimal fluoride level in drinking water to prevent tooth decay. Your local dentist or pediatrician can prescribe daily fluoride brushing, tablets, or drops for you and your children to ensure you receive enough fluoride.

Tips for Protecting Your Water

- Eliminate excess use of lawn and garden fertilizers and pesticides – they contain hazardous chemicals that can reach your drinking water source.
- Pick up after your pets.
- Dispose of chemicals properly; take used motor oil to a recycling center.

For more information regarding this report, please contact either:

- 412th Test Wing Public Affairs (661-277-1454)

Common Water Quality Observations

The 412th Bioenvironmental Engineering Flight and 412th Civil Engineering Squadron make every effort to ensure the water provided to EAFB is safe for consumption and the installation is notified should water quality deteriorate.

Some locations may experience brown or rusty water coming from their faucets; more often in older buildings or houses. This is usually caused by a higher concentration of minerals in the water. This does not mean that the water is not safe. Any brown or rusty water that does not run clear after running faucets for several minutes should be reported to housing or facility maintenance.

Another common occurrence is white cloudy water. This is due to more oxygen in the water and most often noticed during colder months. Any cloudy water that does not clear up after sitting for a couple minutes should be reported to facility or housing maintenance.
